                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

```

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.G. and de Jong, F.G. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc

MAPPING INFORMATION:

restriction digest.

SOURCE INFORMATION:

all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 0); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by

Submitted (05-SEP-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requeststeanger.ac.uk
On Sep 6, 2001 this sequence version replaced gi:14272282.
During sequence assembly data is compared from overlapping clones.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PRI 05-SEP-2001

The BB16 library was contributed by the Soares laboratory and it was constructed and normalized as described by Bonaldo, M.F., Lennon, G. and Soares, M.B. (1996), Genome Research 6 (9): 791-806. RNA was prepared from dissected brains of adult worker bees of various ages and various behavioral groups. "

First strand CDNA was primed with a primer prepare mouse Lissues. First strand CDNA was primed with a primer prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. Second Strand CDNA was prepared with the primer adapter of Sequence [5, WICH ANDI and SSTI. Cloning sites, 5, end: XhoI; 3, end: SSTI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (10-70L-2000) Yoshihide Hayashizaki, The Institute of Physical and Chemical Research (RIKEN), Laboratory for Genome Exploration Research Group. ```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.00 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114)pblAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Sequences AAH27131 - AAH27151 represent human gene untranslated regions where the corresponding mRNA fragment has RNA binding protein (RBP) binding activity. RBPs mediate the processing of pre-mRNA, the transport of mRNA from the nucleus to the cytoplasm, mRNA stabilisation.

Translational efficiency, and the sequestration of some mRNAs. Therefore modification of post-transcriptional protein expression in eukaryotic cells may be carried out through the targeting specific interactions of proteins that bind to RBPs. The gene fragments of the invention are used to identify their optimized sub-fragments, compounds that affect RNA/RBP interaction or mRNA functionality; or RBPs that interact with the compounds identified using the gene fragments are potentially useful for therapeutic regulation of gene expression, such as in cases of neurodegeneration; stroke; cardiovascular disease; hypertension; cancer; inflammation; metabolic disorders (Obesity and diabetes) and bacterial or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                viral infection. The present sequence is one of gene fragments of the

oncogene (MPL) gene, useful for studying the function of and expressing \overline{\rm MPL} protein for use in screening drugs for treating diseases related to
                                                                                                        The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human myeloproliferative leukaemia virus oncogene (MPL) gene located on chromosome lp34, and methods for haplotyping and/or allele-specific objects the methods of the invention make use of primer-extension oligonucleotides (ASOs) as probes and primers and/or The polymucleotides for detecting MPL gene polymorphisms. The polymucleotides and screened compounds are useful for the treatment of diseases associated with MPL activity, such as companital amegakaryocytic thrombocytopaenia (CAMT). The present sequence represents a reference sequence for human MPL gene exons 9-10. Note: This sequence encodes for only part of the MPL protein shown
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The

polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders forensists, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amno acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

AATYONS UP and AATYONS I represent the close and accounty the composition of the invention and are capable of being processed by a Trichoderma host cell. H. resinae glucomylase P has higher a Trichoderma host cell. H. resinae glucomylase P has higher debranching and dextrinase activity than conventional glucomylase-pullulanase mixtures. T. reesei secretes enzymes that are important for the degradation of complexes around and in starch granules. The recombinant glucomylase P enzyme produced by the Trichoderma host cell is useful in applications requiring the hydrolysis of gelatinised starch or the presence of a debranching activity. These applications in clude starch analysis, the manufacture of glucose syrups, production of straight linear dextrin for use in food, medicines and cosmetics, and in the preparation of food fibers by the enzyme to laundry and dish washing detergents, in wood and textile industry applications such as the preparation of plywood adhesives. It can also be used in the sacrification of lignocellulosic materials, the preservation of protein-containing animal or vegetable fodder, the preparation of products and to improve utilisation of sugar present in such feedstuff. When used as a feed additive for food animals, the recombinant bacterial blommass may be added directly to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                beta2 adrenergic receptor; genetic variation identification; hypertrophy; disease diagnosis; hypertension; prostatic disease; pulmonary disorder; asthma; peripheral vascular disorder; neuropsychic disorder;

cardiovascular disorders such as mycocardial infarction, unstable angina, hypertension, atherosclerosis and stroke. They are also useful for predicting the likely cardiovascular status of a patient given a retained the likely cardiovascular status of a patient given a retained regimen comprising administration of cardiovascular drugs (e.g., ACE inhibitors, beta-adrenergic receptor antagonists (beta-blockers) one or more polymorphic markers browides a basis for predicting the outcome of a treatment regimen. Fragments of the genes comprising a polymorphic site may be used as primers and probes for detecting genetic polymorphisms or in molecular trays for high throughput screening. The genes, and the proteins they encode are useful in the screening of potential cardiovascular drugs. Determination of an individual's polymorphic pattern reduces or infaintante patients from chinical trials who are predicted to be non-responsive, or at a risk for an adverse response, to a particular treatment regimen. Adverse results in an early trial can be evaluated to identify polymorphic patterns so that the adverse results can be evaluated correlated with a sub-population of the test population, permitting exclusion of such sub-populations from the treatment group. Beneficial drugs can be approved for use in the appropriate population, thereby in the case of the number of patients required for a patient which in
The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the status in an individual and to newly identified polymorphisms in the receptor type 1 (ATI) and type 2 (ATI), angiotensinogen (ACT), renin, aldosterone synthase, endothelin receptor type A and beta-adrenergic receptors 1 and 2. The method comprises determining the sequence at one or more polymorphic positions within these genes, and comparing the pattern of polymorphisms from the individual with a reference polymorphic predetermined cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         decreasing the number of patients required for a clinical trial, which in turn decreases the duration and cost of such trials. The present sequence represents the human beta-adrenergic receptor-2 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   coding region (GenBank Y00106/g293708). The polymorphic sites identified are 839A/G, 872C/G, 1045A/G, 1284C/T, 1316A/C, 1846C/G, 2032A/G, 2068 no insert/G/C and 2070 no insert/C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chromosome 5q31(12); disease predisposition; asthma; hypertension; congestive heart failure; ischemic heart disease; arrhythmia; obesity; diabetes; vascular disease; premature labour; migraine; anaphylaxis; chronic obstructive pulmonary disease; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is a fragment of the C allele of the human beta2 adrenergic receptor (beta2AR) gene, which is located on chromosome the presence of two copies of the T alleles, and it has been shown that the presence of two copies of the T allele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, arrhythmia, obesity, diabetes, vascular disease, premature labour, migraine, anaphylaxis and chronic obstructive pulmonary disease (COPD). The gene can, therefore, be used to predict the susceptibility of an individual to these diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Glucoamylase P; hormoconis resinae; debranching activity; enzyme; dextrinase activity; Trichoderma reesei; starch granule; preservation; hydrolysis; gatatinised starch; glucose syrup; straight linear dextrin; saccharification; lignocellulosic material; sugar utilisation; feed additive; ss.

```
Hormoconis resinae glucoamylase P, respectively. These sequences are used in the composition of the invention and are capable of being processed by a Trichoderma host cell. H. resinae glucoamylase P has higher debranching and dextrinase activity than conventional glucoamylase-pullulanase mixtures. T. reesel secretes enzymes that are important for the degradation of complexes around and in starch granules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hormoconis resinae glucoamylase P gene construct - for transforming Trichoderma to produce recombinant glucoamylase P \,

starch or the presence of a debranching activity. These applications starch or the presence of a debranching activity. These applications starch or the presence of a debranching activity. These applications include starch manalysis, the manufacture of glucose syrups, production of straight linear dextrin for use in food, medicines and cosmetics, and in the preparation of food fibers by the enzymatic treatment of seed husks or brans. The enzyme can also be used as an additive to laundry and dish washing detergents, in wood and textile industry applications such as the preparation of plywood adheaves. It can also be used in the saccharification of lignocellulosic materials, the preservation of feedstuff from meat by products and to improve utilisation of sugar present in such feedstuff. When used as a feed additive for food animals, the recombinant bacterial biomass may be added directly to the
The recombinant glucoamylase P enzyme produced by the Trichoderma host

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "This nucleotide differs from the wild type nucleic acid sequence represented in AAZ00773" replace(934,9)
                                            AAW7577) having an arginine residue at position 16. A novel method for identifying individuals susceptible to adverse responses to regular administration of beta agonists comprises: (a) identifying in a genomic nucleic acid sample from the individual first and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                             second alleles of the beta 2-adrenergic receptor gene, and (b) classifying an individual as susceptible if first and second alleles both encode Arg at residue 16 of the beta 2-adrenergic receptor protein. Beta 2-adrenergic receptor protein. Beta 2-adrenergic receptor protein. Beta 2-adrenergic receptor protein. Beta 2-adrenergic receptor gene alleles may be identified by any known method e.g. denaturing gel electrophoresis or PCR amplification (see also AMYS5615-17). Identification preferably comprises amplifying a portion of each allele which includes the sequence encoding residue 16, and optionally also comprises determining nucleotide sequences of these portions (e.g. by automated sequence analysis). The invention identifies a known polymorphism in the beta 2-adrenergic receptor gene as being linked
                   This cDNA sequence codes for human beta-2-adrenergic receptor (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "This nucleotide differs from the wild type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "This nucleotide differs from the wild type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "This nucleotide differs from the wild type

```
This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including myocardial infarction and stroke. Other conditions that can be determined include neuropsychiatric disease, such as depression, anxiety, attention deficit disorder with hyperactivity, eating disorder. Diseases of the autonomous nervous system, e.g. Bradbury-Egglesston, SNy-Drager and Riley-Day syndromes having selective noradrenergic-receptor disposition, or migraine, allergic conditions, e.g. asthma and atopic disorders, and metabolic illnesses, e.g. morbid obesity including predicting a change in weight, using body mass index, can also be determined. The beta 2-adrenergic receptor sequence variants can be used to develop therapeutics and/or lifestyle drugs. Individual specific beta 2-radrenergic receptor appoint sequence represents a variant of the wild type human beta 2-adrenergic receptor gene which is represented in AA200773.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
